

Preliminaries

Assignment 1: Hello & Welcome to R (Due Week 1)

Prof. Jack Reilly

F2025

Readings

- Read the course syllabus (all parts of [this website](#))
- Recommended reading:
 - **RDS**, introduction

Data & Computational Work

The main purpose of this week's assignment is to get your computer ready for all the work in the class. This means, primarily, installing software.

Install R on your computer

Begin by installing R (<http://cloud.r-project.org>). Choose the version appropriate for your computing platform:

- If you use macOS with an Apple Silicon processor (i.e. an M-series processor), then install [R for macOS's Apple Silicon build](#). This version does not work on older, Intel-based Macs.
- If you use macOS with an Intel processor, then install [R for macOS's Intel build](#).
- If you use Microsoft Windows, then install [R for Windows](#).
- If you use Linux, [choose your distribution](#) and install the R package for it.

Install RStudio on your computer

- If you use macOS (whether Apple Silicon or Intel), [install this version of RStudio](#).
- If you use Windows, [install this version of RStudio](#).
- If you use Linux, [choose your distribution from the download page](#).

Confirm things work

- R is really a great big calculator. Let's do some calculations!
 - Add 2 and 3 together
 - Multiply 4 by 6
 - Divide 10 by 5
